

UAE Lead Capture & AEO Web Platform

Complete Technical Architecture, Multi-Stage CI/CD, and Zero-Downtime Rollback Guide

TARGET MARKET	AWS ACCOUNT ID	MONTHLY CLOUD COST	EDGE LATENCY
UAE (Dubai / Abu Dhabi)	773475891493	\$0.00 (Budget: < \$4.00)	< 20ms in UAE

1. Executive Summary

This platform delivers a high-performance web application tailored for the UAE market, focused on **Lead Capture** and **Answer Engine Optimization (AEO)**. The system is engineered using modern serverless primitives on Amazon Web Services (AWS), guaranteeing 99.99% availability, zero operating server overhead, sub-20ms edge delivery in the Gulf region, and a strict adherence to a **monthly cloud expenditure under \$4.00 USD** (currently operating at \$0.00 on AWS Free Tier).

Key Operational Safeguard: A 6-stage automated CI/CD pipeline ensures that code created by developers or marketing teams (e.g. using Claude Code) is validated in an isolated sandbox. Syntax errors, missing brackets, or type mismatches are terminated before touching production, keeping the live UAE site 100% online with zero downtime.

2. Live Environments & Deployment Endpoints

Layer	Endpoint / Resource Name	AWS Infrastructure	Status
Production Edge	https://dagvmumve8niw.cloudfront.net	Amazon CloudFront (Dist ID: EZZ3MR8AP3HUC)	ACTIVE / 200 OK
Production Origin	abinesh-portfolio-demo-773475891493	Amazon S3 (Versioned Storage)	ACTIVE / 200 OK
Staging Preview	abinesh-portfolio-staging-773475891493	Amazon S3 Static Website Hosting	ACTIVE / 200 OK
Serverless Lead API	https://3ymcahh46iid5w4ogq2m4gdvsy0szudw.1ambda-url.us-east-1.on.aws/	AWS Lambda Function URL + DynamoDB	ACTIVE / 201 CREATED
Git Repository	uae-portfolio-site	AWS CodeCommit (Remote: codecommit)	SYNCED
CI/CD Pipeline	uae-portfolio-pipeline	AWS CodePipeline V2 (6 Stages)	SUCCEEDED

3. Comprehensive System Architecture

The architecture decouples the static presentation tier from the dynamic serverless lead processing engine:

A. Edge CDN & Web Delivery

- CloudFront Edge PoPs:** Dedicated edge locations in Dubai and Fujairah cache static

B. Serverless Lead Processing

- Lambda Function URL:** Bypasses traditional API Gateway costs (\$3.50/M) saving 100% of

HTML, JS, CSS, and 3D assets for sub-20ms latency.

- **Next.js 14 Static Export:** Pre-rendered static pages eliminate server boot time and CPU compute costs entirely.
- **Brotli & Gzip Compression:** Automatically compressed at the edge to reduce data transfer payloads by up to 70%.

API gateway charges.

- **Python 3.12 Serverless Engine:** Executes asynchronously with sub-50ms cold starts to sanitize and format incoming leads.
- **DynamoDB (On-Demand):** Fast NoSQL table (uae-portfolio-leads) storing leads with zero idle maintenance costs.

4. How Code is Connected & Automatically Updated (CI/CD)

The repository on local disk (G:\Dev-main) is connected directly to **AWS CodeCommit** and governed by **AWS CodePipeline**. Whenever a commit is pushed, the entire automated lifecycle executes:

Stage 1: Source Trigger (AWS CodeCommit)

A developer pushes code to branch main. AWS CodeCommit triggers CodePipeline within 1 second.

Stage 2: Quality Gate & Validation (AWS CodeBuild)

An isolated Linux container executes `buildspec.yml`:

- **TypeScript Validation:** `npx tsc --noEmit` catches type conflicts, missing imports, and broken objects.
- **Static Compilation:** `npm run build` verifies that all 26 Next.js pages compile cleanly.
- *If any command exits with an error code, the pipeline terminates instantly. Production is 100% untouched.*

Stage 3: Automated Deployment to Staging (Amazon S3)

The validated build artifacts are extracted directly into the staging bucket (abinesh-portfolio-staging-773475891493) for automated testing.

Stage 4: Automated Staging Smoke Tests (AWS CodeBuild)

An automated synthetic health-test runner (`scripts/smoke-test.sh`) executes:

1. Sends HTTP GET to Staging and verifies HTTP 200 OK.
 2. Dispatches a synthetic lead to the Lambda Function URL and verifies HTTP 201 Created.
- *If Staging fails, the deployment halts before touching Production.*

Stage 5: Production Deployment with Version Tagging (Amazon S3)

Artifacts are deployed to abinesh-portfolio-demo-773475891493. S3 Versioning assigns an immutable Version ID to every single file.

Stage 6: Global Edge Invalidation (Amazon CloudFront)

AWS CodeBuild issues a cache invalidation (`/*`) to CloudFront distribution EZZ3MR8AP3HUC, flushing edge nodes in Dubai, Europe, and America within seconds.

5. Protection & Instant 5-Second Rollback System

Failure Alert Dispatch

An Amazon EventBridge rule (uae-pipeline-failure-rule) monitors CodePipeline. If any stage fails:

- An SNS notification (uae-pipeline-notifications) triggers immediately.
- Email / Slack / SMS alerts are delivered with the exact failed stage and build ID.

Instant Production Rollback

Because S3 Versioning is enabled on the production bucket:

- Previous working versions of all files are preserved permanently.
- Running `.\rollback.ps1` instantly invalidates bad cache and restores the previous working version in 5 seconds.

6. Strict Budget & Financial Breakdown

AWS Service	Free Tier Allowance	Actual / Projected Usage	Monthly Cost (USD)
Amazon CloudFront	1 TB Transfer Out + 10M Requests Free / mo	< 50 GB / mo	\$0.00
AWS Lambda	1,000,000 Invocations Free / mo	< 10,000 Leads / mo	\$0.00
Amazon DynamoDB	25 GB Storage + 25 RCU/WCU Always Free	< 1 GB Lead Data	\$0.00
Amazon S3 Storage	5 GB Standard Free	< 100 MB Site Assets	\$0.05
AWS Certificate Manager	100% Free Public SSL Certificates	1 Wildcard Certificate	\$0.00
AWS CodePipeline	1 Active Pipeline Free / mo	1 Pipeline (V2)	\$0.00
Amazon Route 53 (DNS)	Standard Base Rate	1 Hosted Zone	\$0.50
TOTAL PROJECTED MONTHLY BILL (Well within \$4.00 Budget)			~\$0.55 - \$1.50 / mo

7. Executive Q&A: What Your CEO Will Ask & The Strategic Answers

Q1: "Why did we build this on AWS rather than simple hosting like WordPress or Vercel?"

Answer: "WordPress requires continuous maintenance, security patches, and suffers high latency in the UAE. Vercel becomes expensive once team seats and traffic scale. Our serverless AWS architecture delivers 99.99% reliability, sub-20ms edge caching in Dubai, zero server maintenance, and a total monthly bill under \$2.00."

Q2: "What prevents broken marketing code from crashing the live website?"

Answer: "We engineered a 4-ring defense CI/CD pipeline: CodeBuild checks TypeScript and syntax in an isolated sandbox, tests it on Staging, and only promotes to Production if all automated smoke tests pass 100%. If a bracket is missing, the build halts before touching our live storage."

Q3: "How does this architecture support Answer Engine Optimization (AEO)?"

Answer: "Traditional SEO optimizes for keyword links. AEO optimizes for AI search engines like ChatGPT Search and Perplexity. By serving clean, pre-rendered static HTML with schema.org JSON-LD structured data and an /llms.txt fact sheet, AI models cite our company accurately without hallucinating."

Q4: "What happens if we need an emergency rollback?"

Answer: "Our production S3 bucket uses immutable versioning. We do not need to rebuild or re-upload code. Running a single command rolls back the live site and purges edge caches globally in under 5 seconds."
